

Week Four: Point Cloud Lidar

Andrew Walker Journal Submission 2/7/2025

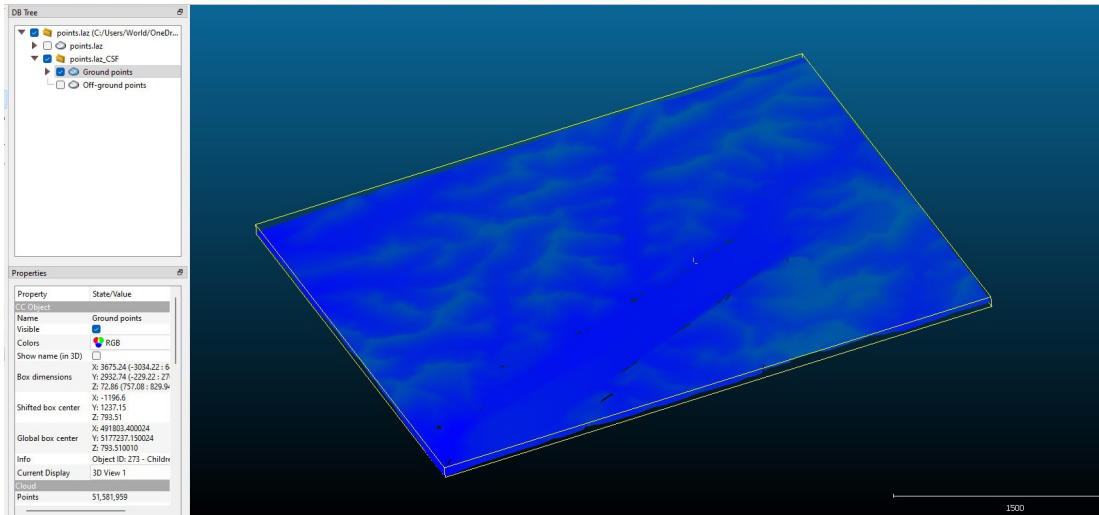

I was able to create a mesh of the hilly terrain in the Pullman, WA Area. I suspect I did some things wrong because the file took a very long time to export and get into rhino because it came out to be 12 GB. At this point I was too feeling too sick from my flu to keep going. It was less than I had hoped for but all that I could do. I might try to get a more interesting site with a wider variety of topography and features. The topography I selected had roads and the air strip but the hills were not as exaggerated as I thought they would be.
